

Highland Grain Limited

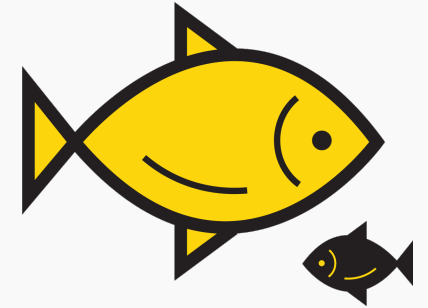

Have used heat recovery on their dryers since around 2006, this includes heat from hired in harvest generators. **Saves around 30%** depending on the barley moisture, ambient temp etc.

Modified two Italian dryers to burn barley screenings. At full capacity they would save approx. **180,000 litres of diesel**. This varies depending on the amount of screenings available each harvest.

Highland Grain are slowly succeeding to link their contracts to an end user and keep the barley local. Focus is on **minimum malt miles**.

Alternative fuel sources are being looked into, from fish based oils to hydrogen, **nothing is off the table**.
